The goal of quantum probability research

Research program

goal

Overview of talk

Introduction

Characterizing Quantum States

Dynamics

Dynamics with initial correlations

Conclusion

- Goal: Formulate quantum theory as a generalization of abstract probability theory.
 - This involves removing most of the physics, e.g.
 - Background spacetime
 - Kinematics vs. dynamics
 - Starting from physical symmetry representations
- Motivation: To properly understand quantum information and computation a qubit should be an abstract probabilistic object.
- Implications:
 - Novel algorithms and proof methods.
 - Clearer analysis of quantum protocols.
 - Apply quantum theory to anything: Quantum Gravity?

correlations

Conclusion

- A physical system A is associated with a Hilbert space $\mathcal{H}_A = \mathbb{C}^d$. States of the system are unit vectors $|\psi\rangle \in \mathcal{H}_A$.
- A measurement is associated with a self-adjoint operator $M^\dagger = M$. By the spectral theorem,

$$M = \sum_j m_j \Pi_j.$$

The outcome m_j occurs with probability $\langle \psi | \Pi_j | \psi \rangle$.

- We can alternatively think of a measurement as a set $\{\Pi_j\}$ of orthogonal projection operators with $\sum_j \Pi_j = I_A$.
- A system AB composed of two subsystems A and B is associated with the Hilbert space

$$\mathcal{H}_{AB} = \mathcal{H}_A \otimes \mathcal{H}_B = \text{span} (|\psi\rangle_A \otimes |\phi\rangle_B).$$

- More generally, the state of a system A is a positive operator ρ acting on \mathcal{H}_A that satisfies $\text{Tr}(\rho) = 1$. The probability of obtaining outcome Π_j in a measurement $\{\Pi_j\}$ is $\text{Tr}(\Pi_j \rho)$.

- Examples:

- *Pure states:* Let $\rho = |\psi\rangle\langle\psi|$. Then,

$$\begin{aligned}\langle\psi|\Pi|\psi\rangle &= \sum_j \langle\psi|j\rangle \langle j|\Pi|\psi\rangle = \sum_j \langle j|\Pi|\psi\rangle \langle\psi|j\rangle \\ &= \text{Tr}(\Pi\rho).\end{aligned}$$

- *Mixed states:* If $|\psi_j\rangle$ is prepared with probability p_j then let $\rho = \sum_j p_j |\psi_j\rangle\langle\psi_j|$ and then

$$\sum_j p_j \langle\psi_j|\Pi|\psi_j\rangle = \text{Tr}(\Pi\rho).$$

Dynamics

Dynamics with initial
correlations

Conclusion

- For a joint state ρ_{AB} on \mathcal{H}_{AB} , define the reduced state on A as

$$\rho_A = \text{Tr}_B (\rho_{AB})$$

where, for an operator,

$$\rho_{AB} = \sum_{jklm} \alpha_{jk;lm} |j\rangle\langle k|_A \otimes |l\rangle\langle m|_B$$

$$\text{Tr}_B (\rho_{AB}) = \sum_{jkl} \alpha_{jk;ll} |j\rangle\langle k|_A.$$

- Then,

$$\text{Tr}_{AB} (\Pi_A \otimes I_B \rho_{AB}) = \text{Tr}_A (\Pi_A \rho_A).$$

Dynamics

Dynamics with initial
correlations

Conclusion

- Restrict attention to a set of density operators and projectors that commute. Label the eigenbasis $\{|a_j\rangle\}$ with the possible values $\Omega_A = \{a_1, a_2, \dots\}$ of a classical variable A . Then,

$$\rho = \sum_j P(A = a_j) |a_j\rangle\langle a_j| \quad \Pi_\Lambda = \sum_{a_j \in \Lambda} |a_j\rangle\langle a_j|,$$

where $\Lambda \subseteq \Omega_A$.

- Hence,

$$\text{Tr}(\Pi_\Lambda \rho) = \sum_{a_j \in \Lambda} P(A = a_j)$$

- For a joint system AB , assume diagonality in a product basis $\{|a_j\rangle_A \otimes |b_k\rangle_B\}$. Then,

$$\rho_{AB} = \sum_{j,k} P(A = a_j, B = b_k) |a_j\rangle\langle a_j|_A \otimes |b_k\rangle\langle b_k|_B,$$

and partial trace gives the marginals.

States

Dynamics

Dynamics with initial
correlations

Conclusion

- Classically, the conditional probability distribution is defined as

$$P(B = b_k | A = a_j) = \frac{P(A = a_j, B = b_k)}{P(A = a_j)}.$$

- What should the quantum analog of this be?

- $\rho_{B|A} = \rho_{AB} \rho_A^{-1}$?

- $\rho_{B|A} = \rho_A^{-1} \rho_{AB}$?

- Neither of these is positive.

Dynamics with initial
correlations

Conclusion

- Define a family of positive products of positive operators

$$G \star^{(n)} H = \left(H^{\frac{1}{2n}} G^{\frac{1}{n}} H^{\frac{1}{2n}} \right)^n.$$

- Two important special cases:

- $G \odot H = \lim_{n \rightarrow \infty} (G \star^{(n)} H) = e^{(\ln G + \ln H)}$

- $G \star H = G \star^{(1)} H = H^{\frac{1}{2}} G H^{\frac{1}{2}}$

- Define conditional states:

$$\rho_{B|A}^{(n)} = \rho_{AB} \star^{(n)} \rho_A^{-1}.$$

- **Cerf-Adami:** $\rho_{B|A}^{(\infty)} = \rho_{AB} \odot \rho_A^{-1}$

- **The $n = 1$ case:** $\rho_{B|A} = \rho_{AB} \star \rho_A^{-1}$

Conclusion

- Classical entropy is given by

$$H(A) = - \sum_A P(A) \ln P(A),$$

and conditional entropy by

$$H(B|A) = H(A, B) - H(A) = - \sum_{A,B} P(A, B) \ln P(B|A).$$

- Quantum entropy is given by

$$S(A) = -\text{Tr} (\rho_A \ln \rho_A),$$

and conditional entropy by

$$S(B|A) = S(A, B) - S(A) = -\text{Tr} \left(\rho_{AB} \ln \rho_{B|A}^{(\infty)} \right).$$

Conclusion

- A conditional probability distribution $P(B|A)$ can be defined as a positive function on $\Omega_A \times \Omega_B$ that satisfies

$$\sum_B P(B|A) = 1.$$

- A quantum conditional state $\rho_{B|A}$ with the \star -product can be defined as a positive operator on $\mathcal{H}_A \otimes \mathcal{H}_B$ that satisfies

$$\text{Tr}_B (\rho_{B|A}) = I_A.$$

Problems

Conditional
independence

Markov chains

Applications

Dynamics

Dynamics with initial
correlations

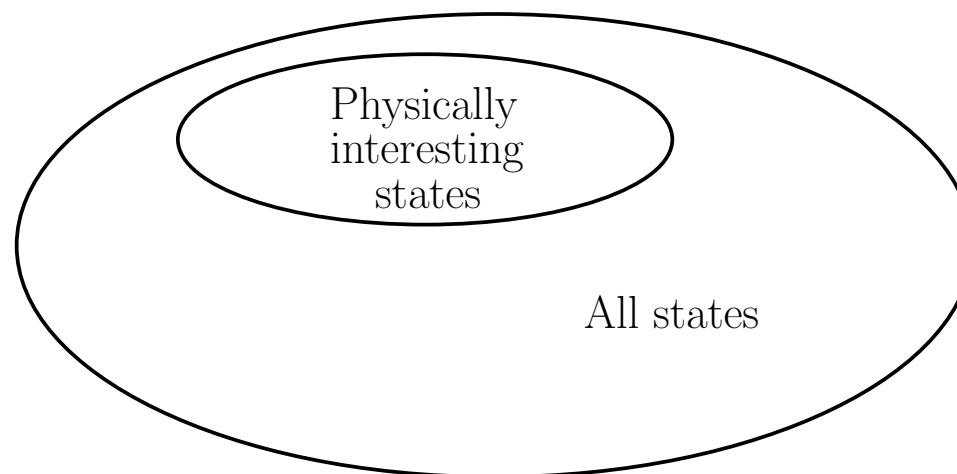

Conclusion

Definition. A and B are conditionally independent given C if any of the following equivalent conditions holds:

- $P(A|B, C) = P(A|C)$
- $P(B|A, C) = P(B|C)$
- $P(A, B|C) = P(A|C)P(B|C)$
- $H(A : B|C) = 0,$

where

$$\begin{aligned} H(A : B|C) &= H(A|C) - H(A|B, C) \\ &= H(A, C) + H(B, C) - H(C) - H(A, B, C). \end{aligned}$$

Quantum conditional independence

Research program

goal

Overview of talk

Introduction

Characterizing Quantum States

Problems

Conditional independence

Markov chains

Applications

Dynamics

Dynamics with initial correlations

Conclusion

Definition. A and B are conditionally independent given C if $S(A : B|C) = 0$, where

$$S(A : B|C) = S(A, C) + S(B, C) - S(C) - S(A, B, C). \quad (1)$$

Theorem. If $S(A : B|C) = 0$ then

- $\rho_{A|BC}^{(n)} = \rho_{A|C}^{(n)}$
- $\rho_{B|AC}^{(n)} = \rho_{B|C}^{(n)}$
- $\rho_{AB|C}^{(n)} = \rho_{A|C}^{(n)} \rho_{B|C}^{(n)}$

- For \odot all converse implications hold.
- For \star first two converse implications hold.

States

Problems

Conditional
independence

Markov chains

Applications

Dynamics

Dynamics with initial
correlations

Conclusion

- A general state of N systems can be written as

$$\rho_{A_1, A_2, \dots, A_N} = \rho_{A_N | A_1 A_2 \dots A_{N-1}}^{(n)} \star^{(n)} \dots \star^{(n)} \rho_{A_3 | A_2 A_1}^{(n)} \star^{(n)} \rho_{A_2 | A_1}^{(n)} \star^{(n)} \rho_{A_1}.$$

- Imposing the constraint $S(A_j : A_1 A_2 \dots A_{j-2} | A_{j-1}) = 0$ gives

$$\rho_{A_1, A_2, \dots, A_N} = \rho_{A_N | A_{N-1}}^{(n)} \star^{(n)} \dots \rho_{A_3 | A_2}^{(n)} \star^{(n)} \rho_{A_2 | A_1}^{(n)} \star^{(n)} \rho_{A_1}$$

- This decomposition and the one that follows can be used in a quantum generalization of *belief propagation* algorithms.

ML & D. Poulin, Ann. Phys. 323 1899 (2008).

Quantum Markov Networks

Definition. A *Quantum Markov Network* (G, ρ) is an undirected graph $G = (V, E)$, where the vertices are quantum systems, and a density operator ρ_V that satisfies $S(A : B|C) = 0$ for all disjoint $A, B, C \subseteq V$ such that every path from A to B intersects C .

Conclusion

Theorem. *If (G, ρ) is a Quantum Markov Network and ρ is strictly positive then*

$$\rho_V = \frac{1}{Z} \bigodot_{C \in \mathfrak{C}} \nu_C,$$

where \mathfrak{C} is the set of cliques in G .

■ Alternatively,

$$\rho_V = \frac{1}{Z} e^{-\beta \sum_{C \in \mathfrak{C}} H_C},$$

where $H_C = -\frac{1}{\beta} \ln \nu_C$.

■ Converse does not hold: there are extra constraints on the local Hamiltonians.

Conclusion

- Given a map $\mathcal{E}_{B|A} : \mathfrak{L}(\mathcal{H}_A) \rightarrow \mathfrak{L}(\mathcal{H}_B)$, define an operator on $\mathcal{H}_A \otimes \mathcal{H}_B$ via

$$\varrho_{B|A} = \sum_{jk} |j\rangle\langle k|_A \otimes \mathcal{E}_{B|A'} (|k\rangle\langle j|_{A'}).$$

- Then, $\mathcal{E}_{B|A}(\rho_A) = \text{Tr}_A (\varrho_{B|A} \rho_A)$.

Theorem. $\mathcal{E}_{B|A}$ is CPT iff $\varrho_{B|A}^{T_A}$ is a valid conditional state, where, for

$$\varrho_{B|A} = \sum_{jklm} \alpha_{jk;lm} |j\rangle\langle k|_A \otimes |l\rangle\langle m|_B$$

$$\varrho_{B|A}^{T_A} = \sum_{jklm} \alpha_{kj;lm} |j\rangle\langle k|_A \otimes |l\rangle\langle m|_B.$$

Definition. An *Acausal Conditional State* of B given A is a positive operator $\rho_{B|A}$ on $\mathcal{H}_A \otimes \mathcal{H}_B$ such that

$$\text{Tr}_B (\rho_{B|A}) = I_A.$$

Definition. A *Causal conditional state* of B given A is an operator $\varrho_{B|A}$ on $\mathcal{H}_A \otimes \mathcal{H}_B$ such that $\varrho_{B|A}^{T_A}$ is an acausal conditional state.

Definition. A *Causal joint state* on AB is an operator ϱ_{AB} on $\mathcal{H}_A \otimes \mathcal{H}_B$ that can be written as

$$\varrho_{AB} = \varrho_{B|A} \star \rho_A$$

for some causal conditional state $\varrho_{B|A}$ and marginal state ρ_A .

Alternatively $\varrho_{AB}^{T_A}$ is an acausal joint state.

CPT dynamics

Conclusion

- Recall, in deriving CPT maps from unitary dynamics, it is assumed that the system is initially uncorrelated from the environment.

$$\mathcal{H}_A \otimes \mathcal{H}_E = \mathcal{H}_B \otimes \mathcal{H}_{E'}$$

$$\begin{aligned}\rho_B &= \mathcal{E}_{B|A}(\rho_A) \\ &= \text{Tr}_{E'} (U \rho_A \otimes \rho_E U^\dagger)\end{aligned}$$

- Not a good approximation for multi-timestep dynamics with small environments, strongly correlated systems, correlated error models etc.

Does CPT dynamics hold more generally?

Initial correlations

CPT dynamics

Conclusion

- Some have suggested using non CPT dynamics:
 - see e.g. T. Jordan, A. Shaji & E. Sudarshan, Phys.Rev. A 70 052110 (2004).
- More general situations in which CPT dynamics works have also been found:
 - C. Rodriguez-Rosario et. al., J. Phys. A 41 205301 (2008).
 - A. Brodutch et. al., Phys. Rev. A 87 042301 (2013).
 - F. Buscemi (2013). arXiv:1307.0363.
- From conditional states perspective, suggestion to abandon CPT is puzzling due to the analogy:

$$P(B) = \sum_A P(B|A)P(A) \qquad \rho_B = \text{Tr}_A (\rho_{B|A}\rho_A)$$

Nonlinear dynamics

- Classically, given any valid $P(R)$, $P(S|R)$, $P(T|S, R)$ there is a joint probability distribution

$$P(R, S, T) = P(T|S, R)P(S|R)P(R)$$

that has those conditionals and marginal.

- Quantum mechanically, given any valid ρ_A , $\rho_{B|A}^{(n)}$, $\rho_{C|BA}^{(n)}$ we can certainly form

$$\rho_{ABC} = \rho_{C|AB} \star^{(n)} \left(\rho_{B|A}^{(n)} \star^{(n)} \rho_A \right),$$

but this will not necessarily have the right conditionals.

- Why? Monogamy of entanglement.

Nonlinear dynamics

- For a pure state $\rho_{AB} = |\psi\rangle\langle\psi|_{AB}$ with

$$|\psi\rangle_{AB} = \sum_j \alpha_j |j\rangle_A \otimes |j\rangle_B,$$

the conditional state is $\rho_{B|A} = |\psi\rangle\langle\psi|_{B|A}$, where

$$|\psi\rangle_{B|A} = \sum_j |j\rangle_A \otimes |j\rangle_B.$$

- Therefore, for a 3-system Markov Chain

cannot have both $\rho_{A|B} = |\psi\rangle\langle\psi|_{A|B}$ and $\rho_{C|B} = |\psi\rangle\langle\psi|_{C|B}$.

Monogamy for a 3-system chain

- For a 3-system Markov chain, ρ_B , $\rho_{A|B}$ and $\rho_{C|B}$ are compatible with a joint state iff

1. $[\rho_{A|B}, \rho_{C|B}] = 0$. Note: this is equivalent to the existence of a decomposition of \mathcal{H}_B of the form

$$\mathcal{H}_B = \bigoplus_j \mathcal{H}_{B_j^A} \otimes \mathcal{H}_{B_j^C},$$

such that

$$\rho_{A|B} = \sum_j \rho_{A|B_j^A} \quad \rho_{C|B} = \sum_j \rho_{C|B_j^C}.$$

2. $\rho_B = \sum_j p_j \rho_{AB_j^A} \otimes \rho_{B_j^C C}$.

Generalized measurements

- A measurement is described by a set $\{\Pi_x\}$ of orthogonal projectors satisfying $\sum_x \Pi_x = I$.
- More generally, a measurement is described by a set $\{E_x\}$ of positive operators satisfying $\sum_x E_x = I$.
 - This is called a *Positive Operator Valued Measure (POVM)*.

$$\text{Tr}_A(E_x^A \rho_A) = \text{Tr}_{AM} (\Pi_x^M U \rho_A \otimes \rho_M U^\dagger)$$

$$\rho_A = \sum_x P(X = x) \rho_x^A$$

$$\rho_A = \text{Tr}_X (\rho_{A|X} \rho_X)$$

$$P(X = x) = \text{Tr}_A (E_x^A \rho_A)$$

$$\rho_X = \text{Tr}_A (\rho_{X|A} \rho_A)$$

ML & R. Spekkens, Phys. Rev. A 88 052130 (2013).

Definition. A *hybrid operator* on a classical-quantum system $\mathcal{H}_X \otimes \mathcal{H}_A$ is any operator of the form

$$M_{XA} = \sum_x |x\rangle\langle x|_X \otimes M_x^A$$

Theorem. A *hybrid (acausal or causal) conditional state of a quantum system given a classical system* is any operator of the form

$$\rho_{A|X} = \sum_x |x\rangle\langle x|_X \otimes \rho_x^A,$$

where $\{\rho_x^A\}$ is a set of density operators on \mathcal{H}_A .

Theorem. A *hybrid (acausal or causal) conditional state of a classical system given a quantum system* is any operator of the form

$$\rho_{X|A} = \sum_x |x\rangle\langle x|_X \otimes E_x^A,$$

where $\{E_x^A\}$ is a POVM on \mathcal{H}_A .

Bayes' theorem

Examples

Retrodiction

Nonlinear dynamics

- For acausal states we have

$$\begin{aligned}\rho_{AB} &= \rho_{B|A} \star \rho_A \\ &= \rho_{A|B} \star \rho_B,\end{aligned}$$

and hence

$$\rho_{A|B} = \rho_{B|A} \star (\rho_A \otimes \rho_B^{-1})$$

- In the causal case, we can define

$$\varrho_{A|B} = \varrho_{B|A} \star (\rho_A \otimes \rho_B^{-1}),$$

so that

$$\begin{aligned}\varrho_{AB} &= \varrho_{B|A} \star \rho_A \\ &= \varrho_{A|B} \star \rho_B.\end{aligned}$$

Nonlinear dynamics

- The “pretty good” measurement:

$$\rho_{X|A} = \rho_{A|X} \star (\rho_X \otimes \rho_A^{-1}) \quad E_x^A = P(X = x) \rho_A^{-\frac{1}{2}} \rho_x^A \rho_A^{-\frac{1}{2}}$$

- Remote state collapse:

$$\rho_{A|X} = \rho_{X|A} \star (\rho_A \otimes \rho_X^{-1}) \quad \rho_x^A = \frac{\rho_A^{\frac{1}{2}} E_x^A \rho_A^{\frac{1}{2}}}{\text{Tr}_A (E_x^A \rho_A)}$$

- Barnum-Knill approximate error correction:

$$\rho_{A|B} = \rho_{B|A} \star (\rho_A \otimes \rho_B^{-1})$$
$$\mathcal{E}_{A|B}(\cdot) = \rho_A^{\frac{1}{2}} \otimes \rho_B^{-\frac{1}{2}} \mathcal{E}_{B|A}(\cdot) \rho_A^{\frac{1}{2}} \otimes \rho_B^{-\frac{1}{2}}$$

Nonlinear dynamics

- Classically, $P(E|A, X) = P(E|A)$ is sufficient for $P(B|A, X) = P(A|X)$.
- In quantum theory, $\rho_{E|AX} = \rho_{E|A}$ is not sufficient for $\rho_{B|AX} = \rho_{B|A}$ due to nonlinearity and noncommutativity of conditional states.

- Instead one obtains

$$\rho_{B|X} = \text{Tr}_{AE} \left(\rho_{B|AE} \rho_{A|X}^{\frac{1}{2}} \rho_{E|A} \rho_{A|X}^{\frac{1}{2}} \right),$$

which is nonlinear in $\rho_{A|X}$.

- Suggests nonlinear maps may have physically relevant applications.
